

Syllabus	
Topic	Aortic Stenosis

A 70-year-old woman with severe aortic stenosis presents for an open aortic valve replacement (AVR)

**a)**

What value for i) peak flow velocity, ii) mean pressure gradient and iii) valve area would indicate severe aortic stenosis? (3 marks)

- i. Peak flow velocity: .....
- ii. Mean pressure gradient: .....
- iii. Valve area: .....

**b)**

List 3 specific cardiac investigations which may assess the severity of this woman's disease (3 marks)

- 1. ....
- 2. ....
- 3. ....

**c)**

List 6 steps in the pathophysiology of aortic stenosis (6 marks)

- 1. ....
- 2. ....
- 3. ....
- 4. ....
- 5. ....
- 6. ....

**d)**

Give 5 anaesthetic haemodynamic goals for this patient (5 marks)

1. ....
2. ....
3. ....
4. ....
5. ....

**e)**

Give 3 alternative management options for severe aortic stenosis where surgery is deemed inappropriate (3 marks)

1. ....
2. ....
3. ....

Syllabus	
Topic	Aortic Stenosis

Q	Answer	Mark	Guidance
a)	<ul style="list-style-type: none"> <li>i. Peak flow velocity: 4m/s</li> <li>ii. Mean pressure gradient: &gt;40mmHg</li> <li>iii. Valve area: &lt;1cm<sup>2</sup></li> </ul>	3	
b)	<ul style="list-style-type: none"> <li>• Echocardiography/TOE</li> <li>• Cardiac catheterisation (left heart)</li> <li>• Cardiac MRI to assess consequences of stenosis</li> </ul>	3	
c)	<ul style="list-style-type: none"> <li>• Valve narrowing (age, calcification, infection) causes obstruction to LV outflow</li> <li>• LV hypertrophies as higher LV pressure is required to eject blood (increased afterload)</li> <li>• Initially systolic function/LVEF% maintained with normal cavity size</li> <li>• Higher O<sub>2</sub> demand with subendocardial ischaemia</li> <li>• Diastolic dysfunction with impaired filling and impaired relaxation</li> <li>• Pulmonary congestion and raised PA pressure</li> <li>• LV starts to fail with increase in cavity size</li> <li>• Fixed output state with inability to compensate for times of increased flow demand</li> <li>• Blood accelerates through narrowed valve with associated fall in coronary perfusion pressure due to Bernoulli's principle.</li> </ul>	6	
d)	<ul style="list-style-type: none"> <li>• Maintain myocardial oxygen delivery using invasive monitoring to keep systolic and diastolic pressures within 20% baseline</li> <li>• Optimise preload/intravascular volume to fill non-compliant LV – CO monitoring guided</li> <li>• Maintain afterload with vasopressors to maintain adequate MAP and</li> </ul>		

	<p>coronary perfusion which is dependent on aortic root pressure</p> <ul style="list-style-type: none"> <li>• Maintain contractility/avoid negative inotropes and may require positive inotropes</li> <li>• Maintain sinus rhythm for atrial kick (greater contribution to ventricular filling in AS)</li> <li>• Maintain HR 60-80bpm to allow for adequate diastole for coronary perfusion and ventricular filling/reduced O2 demand – adequate analgesia/beta blockade with pacing</li> </ul>	5	
e)	<ul style="list-style-type: none"> <li>• Transcatheter aortic valve implantation (TAVI)</li> <li>• Balloon valvotomy</li> <li>• Medical/conservative management</li> </ul>	3
